24 August 2026, 02:00 UTC

The result

ALIGNMENT	EVIDENCE COVERAGE
Needs attention	Complete

At least one confirmed difference was found between the intended, WordPress-published or externally observed states. All required evidence for this assessment was available.

What is working

- The confirmed publication choice matches both WordPress and the public response.
- The supplied WordPress scan has no blocker or actionable findings.
- WordPress validation and diagnostics completed successfully for the supplied evidence.

Readiness at a glance

OWNER INTENTION AND WORDPRESS	WORDPRESS AND PUBLIC WEBSITE	PUBLIC DISCOVERY FILES
Matches	Needs attention	2 of 4 available
PUBLISHED CAPABILITIES	LIVE MCP CHECK	BROWSER WEBMCP CHECK
2	Not enabled	Not enabled

What to do next

WordPress capabilities compared with the external response

Fix now Owner: Needs investigation

Why it matters: Agents may discover a different publication state or capability set from the one the owner intended or WordPress recorded.

What we found: State: does not match; intended: 2 identifier(s); WordPress: 2 identifier(s); external: 1 identifier(s)

Recommended change: Check for a stale public catalog or an unintended WordPress publication change, restore the intended capability set, then repeat the comparison.

How to confirm it: Repeat the WordPress export and bounded public catalog observation, then confirm the intended, WordPress and external values agree exactly.

Can it be ignored? No. This is a confirmed difference inside the owner-approved assessment scope and should be reconciled or deliberately reclassified by the owner.

What was checked

Check	Result	What it covered
Owner intention compared with WordPress	Matches	Compared the publication choices and capability list confirmed by the owner with the supplied WordPress evidence.
WordPress compared with the public website	Needs attention	Compared the WordPress evidence with fresh public discovery files and the current public catalogue.
Live MCP protocol	Not enabled	Live MCP testing was outside the confirmed assessment scope
Browser-native WebMCP	Not enabled	Browser-native WebMCP testing was outside the confirmed assessment scope

Published capabilities

Read a public page WordPress · Read only · Public data · Low risk	Search public content WordPress · Read only · Public data · Low risk
---	--

Scope and limitations

Included

- Exact intended public state confirmation
- Supported Open for Agents Core 0.3.31 through 0.3.48 evidence review
- Bounded checks of versioned public discovery contracts
- Bounded no-model MCP and WebMCP checks when intentionally enabled
- Separate intended, WordPress-published and external comparisons
- One factual correction round
- One public follow-up check after 30 days

Not included

- Website changes or automatic remediation
- WordPress administrator access
- Security, SEO, traffic, ranking or citation certification
- Testing or claims about any model
- Continuous monitoring

Limits of this assessment

- This is a bounded technical baseline, not a security, SEO, traffic, ranking, citation or model-performance certification.
- An external HTTP observation, including the stated deterministic MCP and WebMCP checks, does not establish support by any particular agent or model. No model was tested.
- No state-changing website tool was executed.

An item that was not verified is kept separate from an item that failed. This assessment does not claim compatibility with every agent or model.

Recheck

Run the assessment again after the identified changes to confirm the current public state.

Suggested by 23 September 2026, 02:00 UTC.

Technical evidence

The canonical evidence JSON contains the complete comparison rows, identifiers, timestamps and SHA-256 evidence identities.
